IMPLEMENTATION 1 OF 2

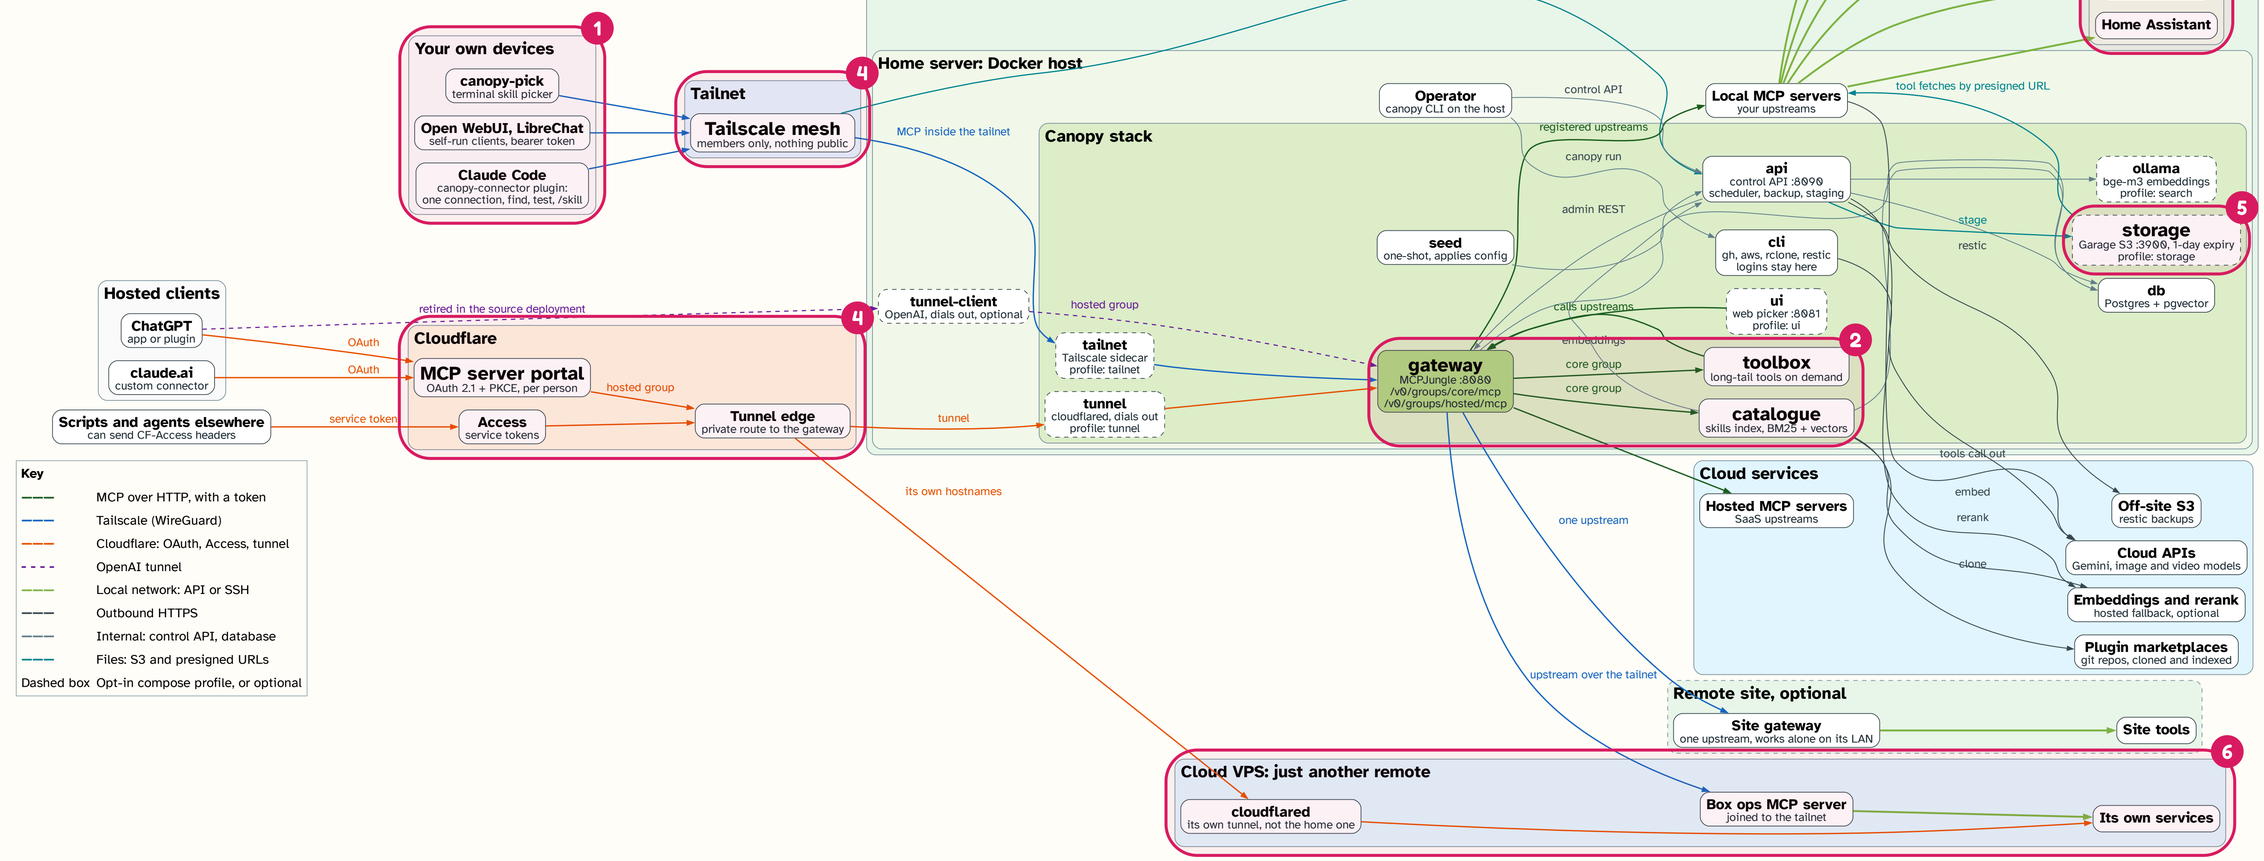

# Home Canopy

## Your AI universe under one roof

The gateway lives on the home network. Runs in the source deployment, except where marked. Canopy ships the stack only: local tools and VPS plugins are yours to add.

## What to look at

1. **Thin clients**: one connector each, no credentials for your tools
2. **Progressive discovery**: agents search, then load only what they need
3. **Local stays local**: the gateway is on the same network as your tools
4. **Secure remote access**: Cloudflare for hosted clients, Tailscale for your devices
5. **File transport**: an S3 bucket with an expiry moves files to the server
6. **Offsite remotes**: a VPS is one more upstream, over the tailnet

ALTERNATIVE: IMPLEMENTATION 2

**Cloud Canopy**: the gateway on a VPS, with a local proxy at home
