IMPLEMENTATION 2 OF 2

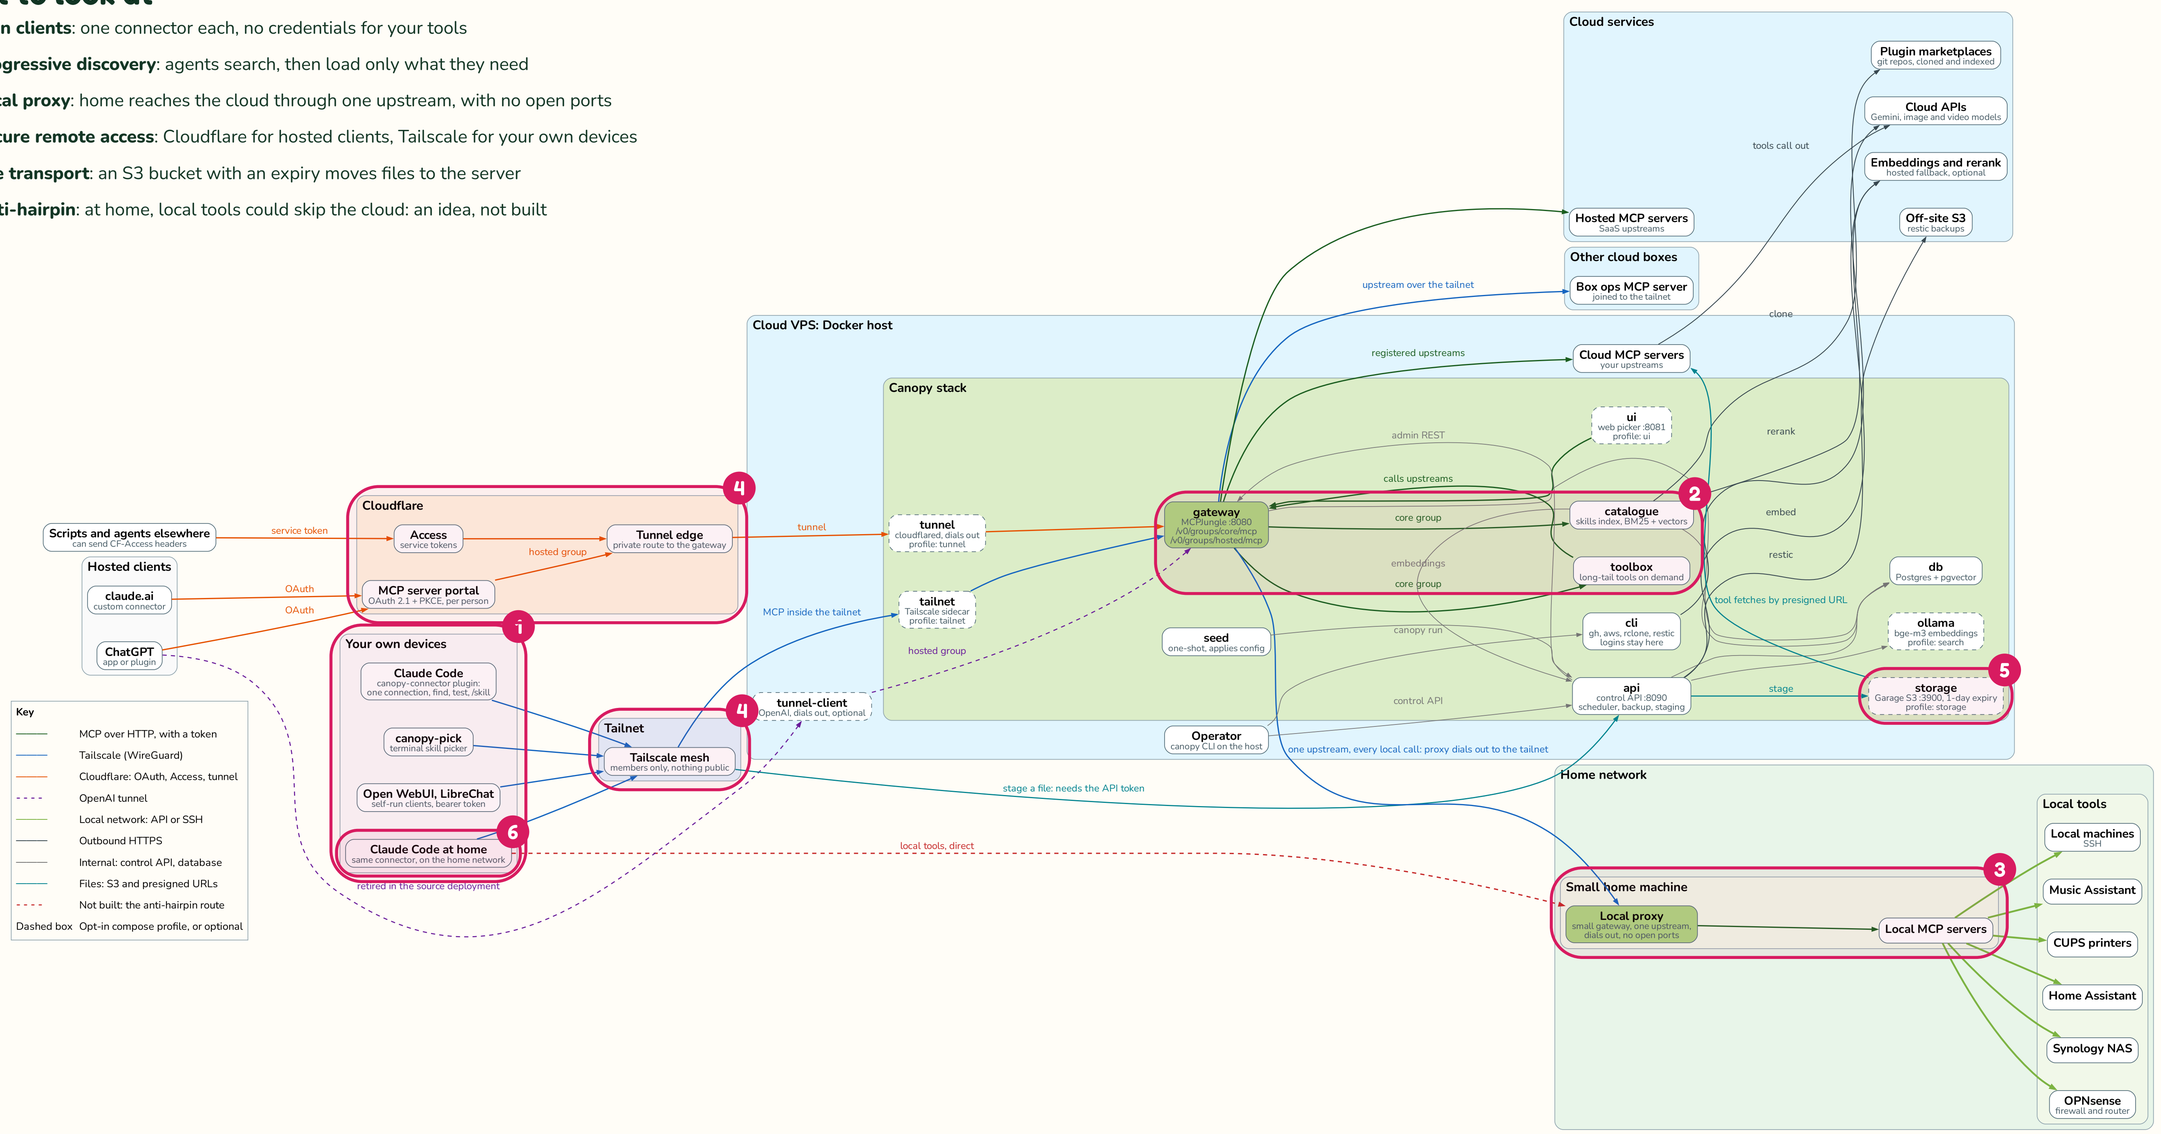

Cloud Canopy

Your AI universe under one roof

The gateway lives on a VPS, and a small proxy reaches home. A proposed template, not deployed as a whole. The proxy is the site gateway pattern, which runs in the source deployment.

What to look at

1. **Thin clients**: one connector each, no credentials for your tools
2. **Progressive discovery**: agents search, then load only what they need
3. **Local proxy**: home reaches the cloud through one upstream, with no open ports
4. **Secure remote access**: Cloudflare for hosted clients, Tailscale for your own devices
5. **File transport**: an S3 bucket with an expiry moves files to the server
6. **Anti-hairpin**: at home, local tools could skip the cloud: an idea, not built
